

# Laboratory simulations of asteroidal regoliths by polarization measurements

**E. Hadamcik, A.C. Levasseur-Regourd**

edith.hadamcik@latmos.ipsl.fr

# Outline

**Introduction**

**Instruments PROGRA<sup>2</sup>-surf and PROGRA<sup>2</sup>-vis**

**Samples**

**Packing density influence on deposited samples**

**Orgueil and C-type asteroids**

**Aubrite from Antarctic and E-type asteroids**

**Summary**

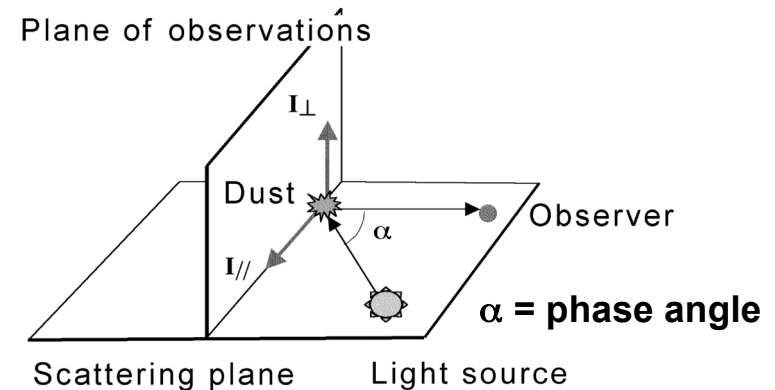

**References**

# Introduction

**Polarization** depends on:  
sizes, size distributions  
(constituent grains and aggregates)  
Complex refractive index  
Structure (porosity), surface properties  
Albedo

Wavelength of observations  
(size parameter, refractive index)

## Geometry of observations

**Polarimetric phase curves for solar system small bodies are smooth and typical of irregular particles**

*Levasseur-Regourd et al., 2003*

# Experimental simulations

## (1) PROGRA<sup>2</sup>-surf instrument

Sample in a cup

Rotation and translation to cover an about 1 cm surface

Generally: Incidence angle = emergence angle = phase angle / 2

More details on the experimental set-ups [Hadamcik et al., 2009a](#)

Hadamcik E.  
Meudon-2010 Dec 1-3

2 randomly polarized lasers:  
543.5 nm and 632.8 nm

A beam-splitter cube:

$I_{\text{perp}}$  and  $I_{\text{par}}$

2 CCD-cameras

Phase angle range: 6°-160°

$$I = I_{\text{perp}} + I_{\text{par}}$$

$$P = \frac{I_{\text{perp}} - I_{\text{par}}}{I_{\text{perp}} + I_{\text{par}}}$$

# Experimental simulations

## (2) PROGRA<sup>2</sup>-vis instrument and size effect

Amplitude of the positive branch vs grains' size for absorbing samples:  
Similar trend for layers and Lifted particles

### Interest of measurements on lifted single grains

Images allow to study P vs particles size

2 mm

A polarization map for agglomerates

Fig. 13.  $P_{max}$  vs particle sizes for compact irregular particles made of different absorbing materials ( $\lambda = 632.8$  nm): (a) lifted particles; (b) deposited particles.

# Experimental simulations

## (3a) Samples

**As analogs for different solar system dust or to study the influence of different physical properties in particles (difficult to model)**  
**Spheres are used to try to understand the different light scattering process**

**-Spheres and aggregates of spheres**

**-Irregular grains and aggregates**

*Hadamcik et al., 2007a*

*Lasue et al., 2007*

**Clouds of particles lifted in reduced gravity conditions or by a nitrogen-draught**

**cometary dust analogs, solid aerosols in atmospheres...**

*Hadamcik et al., 2007b*

*Renard et al., 2005; 2010*

*Hadamcik et al., 2009c*

**single scattering and internal interactions between monomers**

**Layers deposited on a plane surface**

**asteroidal or cometary nuclei surfaces, planetary surfaces,**

**multiple scattering, surface rugosities, packing density..**

*Worms et al., 2000*

# Experimental simulations

## (3b) Samples: powdered meteorites

different size distributions: maximum mass 2g/size for layers and 0.3g for lifted

**CV3 (Allende)** grey

$s < 500 \mu\text{m}$

$s < 50 \mu\text{m}$

**C11 (Orgueil)** dark brown

$s < 400 \mu\text{m}$

$s < 50 \mu\text{m}$

**CO3 (NWA 4868)** brown

$s < 200 \mu\text{m}$

$s < 50 \mu\text{m}$

**Aubrite (ALH78113,82)**

clear greenish

$250 \mu\text{m} < s < 125 \mu\text{m}$

$s < 125 \mu\text{m}$

# Experimental simulations

## (3c) Packing density influence for layers

**Huge agglomerates (cm)**  
**by random deposition**  
**Volume filling factor (VFF)**  
**0.12-0.20** (*Blum et al., 2004*)  
**At a microscopic scale irregular surface**  
*Hadamcik et al., 2006; 2007a*

**Sifted sample**  
- deagglomerate the aggregates  
- macroscopic rough surface  
- VFF  $0.4 \pm 0.1$

**Packed samples**  
VFF 0.6 (0.7)  
Less rugosities than in the previous case

● For deposited spheres when VFF  $\uparrow$ , typical oscillations  $\uparrow$

● For irregular particles when VFF  $\uparrow$   
Amplitude of positive branch  $\uparrow$   
*Worms et al., 1999*

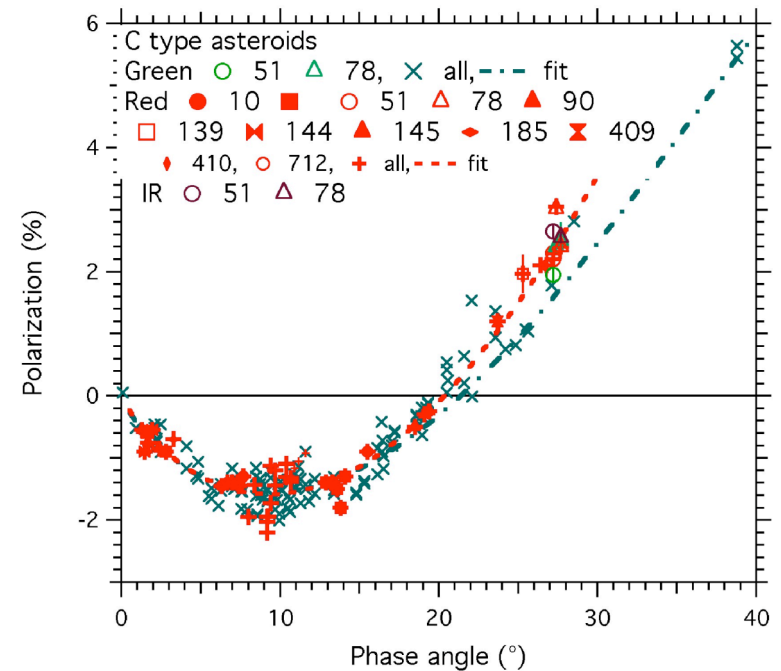

# Experimental simulations

## Phase curves for a C11 meteorite (Orgueil) compared to C type asteroids (1)

**Absorbing carbonaceous material**

**Dark C-type asteroids**

- Inverse color effect in polarization

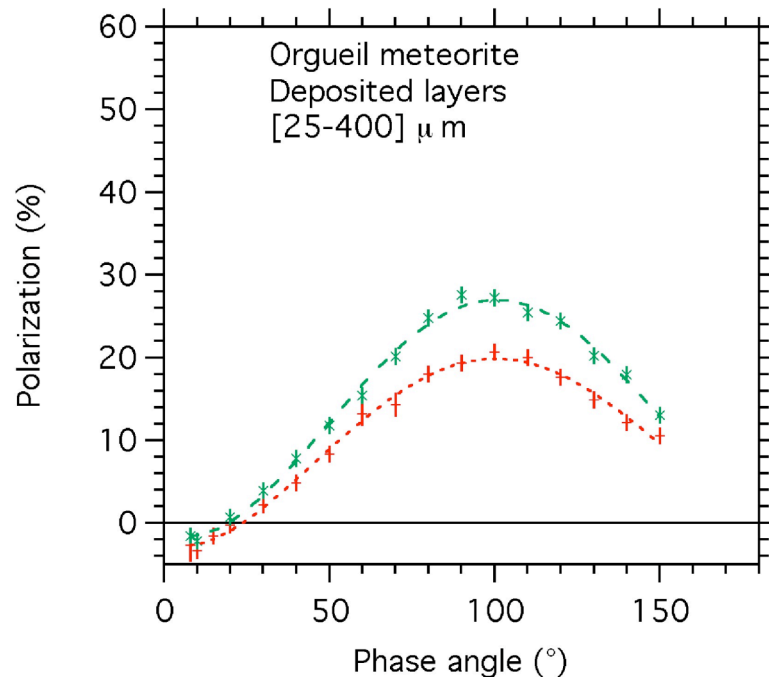

Fig adapted from *Worms et al., 1999*  
*Hadamcik et al., in preparation*

*Hadamcik et al., submitted*

Hadamcik E.  
Meudon-2010 Dec 1-3

# Experimental simulations

## (7) Phase curves for a C11 meteorite (Orgueil) compared to C type asteroids (2)

*Hadamcik et al., in preparation*

Orgueil grinded meteorite

| Wavelength | $\alpha_{\min}^{\circ}$ | $P_{\min} \%$ | $\alpha_0^{\circ}$ | $h \%/^{\circ}$ |
|------------|-------------------------|---------------|--------------------|-----------------|
| 543.5 nm   | 8                       | -1.6          | 19.5               | 0.24            |
| 632.8 nm   | 9                       | -1.7          | 24                 | 0.26            |

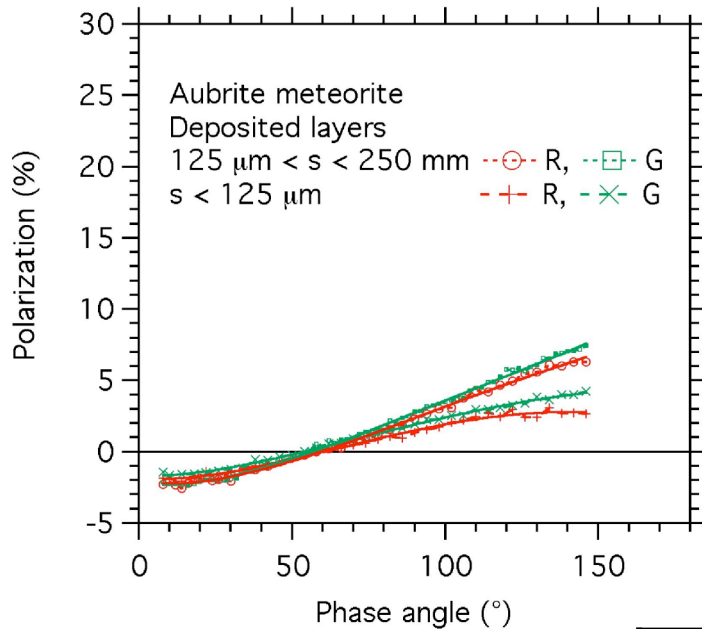

| Filters | $\alpha_{\min}^{\circ}$ | $P_{\min} \%$ | $\alpha_0^{\circ}$ | $h \%/^{\circ}$ |
|---------|-------------------------|---------------|--------------------|-----------------|
| Green   | 9                       | -1.6          | 21.5               | 0.23            |
| Red     | 9                       | -1.6          | 20.3               | 0.28            |

C-type asteroids

- Slope at inversion: in agreement with C-type asteroids observations
  - $P_{\min}$ : in agreement with C-type asteroids observations
  - **But inverse color effect in polarization (in the visible domain)**
- **Orgueil is not a good analog for C-type asteroids**

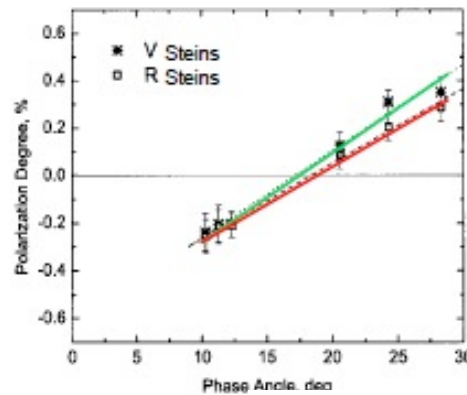

# Experimental simulations

## Phase curves for aubrite (ALH78113,82) as compare to E-type asteroids (1)

*Hadamcik et al. In preparation*

Transparent material  
High albedo asteroid

*Fornasier et al., 2006*

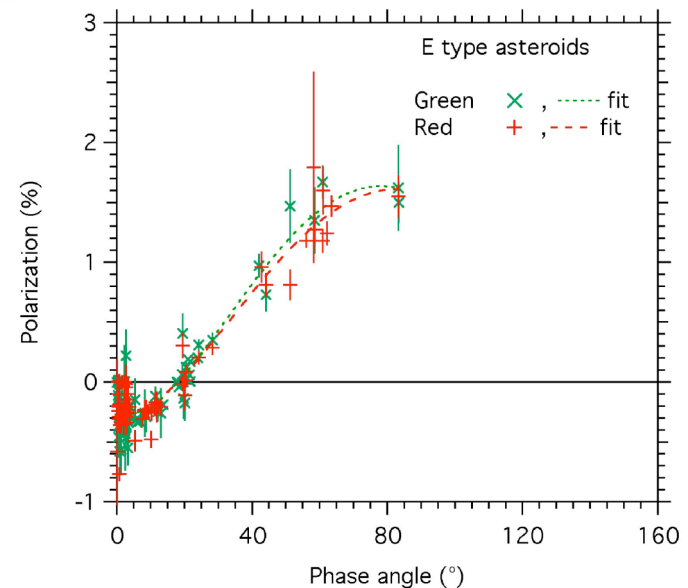

| Filters | $\alpha_0^\circ$ | $h \text{ %/}^\circ$ |
|---------|------------------|----------------------|
| Green   | 17.3             | <b>0.04</b>          |
| Red     | 18.4             | <b>0.03</b>          |

2867 Steins

| Filters | $\alpha_0^\circ$ | $h \text{ %/}^\circ$ |
|---------|------------------|----------------------|
| Green   | 18               | 0.033                |
| Red     | 18               | 0.028                |

E-type asteroids

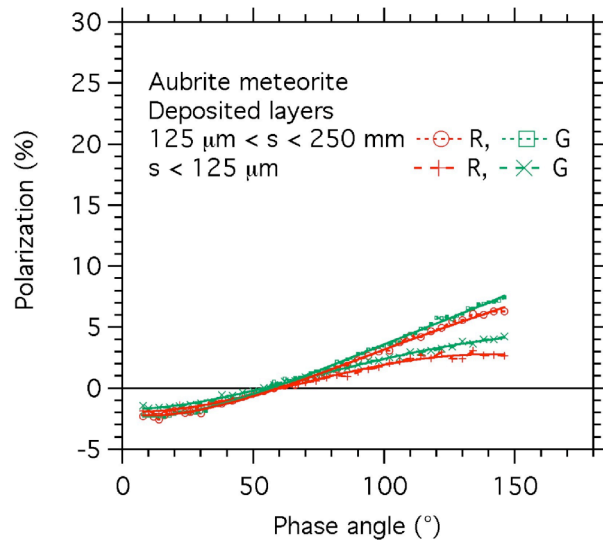

Hadamcik E.  
Meudon-2010 Dec 1-3

*Hadamcik et al., in preparation*

# Experimental simulations

## Phase curves for aubrite (ALH78113,82) as compare to E-type asteroids (2)

| Wavelength |   | $\alpha_{\min}^{\circ}$ | $P_{\min} \%$ | $\alpha_0^{\circ}$ | h%/° | $P_{\max} \%$ |
|------------|---|-------------------------|---------------|--------------------|------|---------------|
| 543.5 nm   | L | 7                       | -2.1          | 55                 | 0.08 | 7.5           |
|            | S | 7.5                     | -1.4          | 57                 | 0.05 | 4.1           |
| 632.8 nm   | L | 8                       | -2.3          | 55                 | 0.07 | 6.4           |
|            | S | 9                       | -1.8          | 55                 | 0.04 | 2.8           |

| Filters | $\alpha_{\min}^{\circ}$ | $P_{\min} \%$ | $\alpha_0^{\circ}$ | h %/° | $P_{\max} \%$ |
|---------|-------------------------|---------------|--------------------|-------|---------------|
| Green   | 6                       | -0.25         | 18                 | 0.033 | 1.65          |
| Red     | 6                       | -0.25         | 18                 | 0.028 | 1.6           |

E-type asteroids

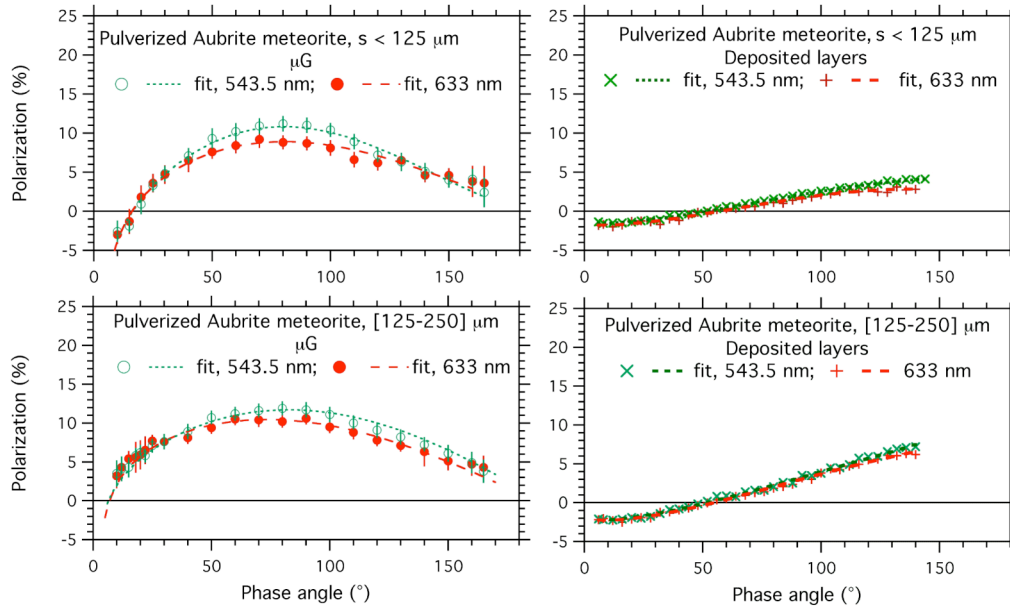

- Inversion angle very different

For smaller sizes:

- Slope at inversion: may be in agreement with E-type asteroids observations
- $P_{\min}$  may be in agreement with E-type asteroids observations
- Color effect in polarization in agreement ( $P \searrow$  when  $\lambda \nearrow$ )

# Experimental simulations

## Phase curves for aubrite (ALH78113,82) as compare to E-type asteroids (3)

*McFadden et al., 2009*

*Levasseur-Regourd et al., in preparation*

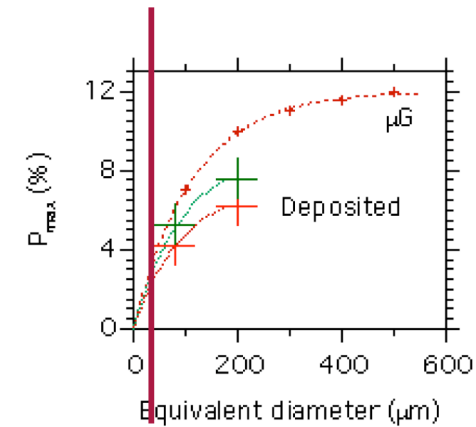

*Hadamcik et al., in preparation*

**The average size seems to be smaller than 20  $\mu\text{m}$**

# Experimental simulations

## Phase curves for aubrite (ALH78113,82) as compare to E-type asteroids (3)

*Hadamcik et al., in preparation*

### Transparent materials with large grains

*Hadamcik et al., 2009a*

The average size seems to be smaller than 20  $\mu\text{m}$

Aubrite from Antarctic seems to be a good analog as polarization is concerned for E-type asteroids

200  $\mu\text{m}$  Quartz, similar trends than Aubrite

Hadamcik E.  
Meudon-2010 Dec 1-3

# Summary

**Linear polarization** phase curves and their parameters (slope, depth of the negative branch and amplitude of the positive branch when available) as a function of the size distribution of the measured grains **allow a rough estimation of the average size distribution of the grains on the asteroidal surface** (but it is difficult to compare one small fragment of meteorite with an integrated observation on the whole surface of an asteroid which is not homogeneous).

● P ↗ when  $\lambda$  ↗ for C-type asteroids (Orgueil not a good analog)

● P ↘ when  $\lambda$  ↗ for E-type asteroids and 2867 Steins

**Aubrite from antarctic seems to be a good analog for 2867 Steins with an average size of the grains smaller than  $20\mu\text{m}$**  (as also suggested by other methods)

● P ↗ when  $\lambda$  ↗ for Lutetia

NWA4868 from Sahara: inverse color effect (weathering?)

**CV3 (Allende) seems to be a good analog for 21 Lutetia with an average size of the grains smaller than  $50\mu\text{m}$**

*see Levasseur-Regourd and Hadamcik presentation and Hadamcik et al., submitted*
